

4.3.14 Y, X are the projections of C on AB and B on AC respectively.
 Now ME is the perpendicular bisector of YX and $\angle YAE = \angle XAE$,
 therefore A, Y, E, X are concyclic (Since E is the arc-midpt of $\widehat{YX}$ of (ABX)
 not containing A). Hence $\angle AEX = \angle AXY = \angle ACB = \angle DCX$
 $\therefore E, X, D$ and C are concyclic, similarly B, M, E and Y are concyclic.
