

4.3.24

Obviously, $\triangle ABD \sim \triangle ACE$ and $\odot DKEL$ is tangent to BD and CE . Then

$$\frac{BK}{KC} \times \frac{BL}{LC} = \frac{BK \times BL}{CK \times CL} = \frac{BD^2}{CE^2} = \frac{AB^2}{AC^2}$$

so AK and AL are isogonal with respect to $\angle BAC$.
